

## Dynamic Web TWAIN: Scan Images From Browser UI, Edit and Upload

*Added Support for GDI+ Decoder and Ability of Adding Text to an Image*

VANCOUVER, BC- (Mar 7, 2012) - Dynamsoft Corporation, an independent software vendor of TWAIN scanning libraries and revision control systems who recently extended its version control cloud service to TFS hosted, today announced the release of Dynamic Web TWAIN 7.0. It is a web browser plugin which enables users to acquire images from a TWAIN-compliant device (scanner, digital camera, capture card, etc.) through a web UI, edit and then save/upload them to a database or web server.

With Dynamic Web TWAIN, users have the most flexibility in choosing a favorite browser -- x86/x64 IE, Firefox, Safari, and Chrome on Windows and Mac OS X.

"Dynamsoft is really good! Dynamic Web TWAIN is easy to implement as part of our application and works well! The program works well in all browsers & has the ability to scan multiple docs at once (ADF support)," commented Praveen Cheruku, Programmer, Eyefinity.

Besides image acquisition from a local/network device, Dynamic Web TWAIN also allows directly loading local images and http downloading images from a web server to the plugin. Both methods involve image decoding. By using image decoders in GDI+, more image formats are supported in the new release.

The new version also introduces the ability of adding text to an image, and it changes the underlying master image. So upon saving or uploading, the annotation text will be saved along with the image(s).

In response to customers' increasing requests, Dynamsoft is developing a new product -- now known as the "Dynamic WebCam" project -- to better work with webcams. The new control is scheduled to make its debut in June. Stay tuned.

### **About Dynamic Web TWAIN**
